

If $2^x = 2^4$. **what does x equal??????**

We can also go from log to exponent thus solving for x :

<p>Evaluate $\log_8 16 = x$</p> $8^x = 16$ $2^{3x} = 2^4$ $3x = 4$ $x = \frac{4}{3}$	<ol style="list-style-type: none"> 1. convert to exponential form 2. write each side as 2 to a power 3. power property of exponents 4. set the exponents equal to each other 5. solve for x
<p>$\log_4 2 = x$</p> $4^x = 2$ $2^{2x} = 2^1$ $2x = 1$ $x = \frac{1}{2}$	<p>$\log_4 4 = x$</p> $4^x = 4^1$ $x = 1$
<p>$\log_6 1 = x$</p> $6^x = 1$ <p>?? will $n^0 = 1$</p> $6^0 = 1 \Rightarrow x = 0$	<p>$\log_{10} 0 = x$</p> $10^x = 0$ <p>No solution</p>

The last examples show us that:

$\log_b b = 1$	$\log_b 1 = 0$	$\log_b 0$ is undefined for all base
----------------	----------------	--------------------------------------

Natural Logarithm: The inverse of the function $y = e^x$ is $\log_e y = x$ or $\ln y = x$.
remember: $\log_e = \ln$

When a relationships in the real world needs to be described with a logarithmic function, they are best described using the natural logarithms.

<p>Evaluate: $\ln e^6 = 6$ (calculator)</p> <p>Write in exponential form:</p> $\log_e e^6 = x$ $e^x = e^6 \rightarrow x = 6$	<p>Write in exponential form:</p> $7.389 = e^x$ $\log_e 7.389 = x$ $\ln 7.389 = x$
<p>Write in exponential form:</p> $\ln 5 = 1.609$ $\log_e 5 = 1.609$ $e^{1.609} = 5$	

Chemistry While in this section, we will cover pH at the end of this chapter

pH of a substance is the measure of acidity of a liquid which is related to the hydrogen ion concentration ($[H^+]$) of the liquid. A liquid becomes more acidic as the number of hydrogen ions increases. A logarithmic equation relates pH to concentration hydrogen ions:

$$pH = -\log[H^+]$$

Optional:

<p>Find the concentration of hydrogen ions, $[H^+]$</p> <p>lime juice pH = 2.2</p> $2.2 = -\log_{10} H^+ \rightarrow -2.2 = \log_{10} H^+$ $10^{-2.2} = H^+ = .00631$	<ul style="list-style-type: none">log is understood to be base 10rewrite with base 10 written and move <u>negative to other side.</u> convert into exponential form solve
<p>cider vinegar pH=3.1</p> $3.1 = -\log_{10} H^+ \quad 10^{-3.1} = H^+$ $-3.1 = \log_{10} H^+ = 7.943 \times 10^{-4}$	<p>egg white pH=8.0</p> $8.0 = -\log_{10} H^+$ $-8.0 = \log_{10} H^+$ $10^{-8.0} = H^+$ $= 1 \times 10^{-8}$

Find the **inverse** of each logarithmic function:

1. Write in exponential form,
2. Switch: x is y and y is x.

$\log_5 x = y$ $5^y = x$ switch $5^x = y$ inverse \downarrow	$\log_2(x+3) = y$ $2^y = x+3$ switch $2^x = y+3$ solve for y $y = 2^x - 3$	$\log_3(x+1) - 2 = y$ move! $\log_3(x+1) = y+2$ $3^{(y+2)} = x+1$ $3^{(x+2)} = y+1$ $y = 3^{(x+2)} - 1$	$y = \ln x + 7$ $\log_e x + 7 = y$ $\log_e x = y - 7$ $e^{(y-7)} = x$ $e^{(x-7)} = y$
--	---	--	---

Since we really don't have the capabilities to calculate y values for a log base b, we need to look at the inverse of a log function. The inverse of a log is an exponential function.

Graph: $\log_5 x = y$

1. rewrite in exponential form:

$$5^y = x$$

2. By the definition of logarithm, the log is the inverse (x is y and y is x).

$$y = 5^x$$

3. graph the exponential function

$y = 5^x$ exponential:		$\log_5 x = y$ log: Switch	
x	y	$x = y$	$y = x$
-2	$\frac{1}{25}$	$\frac{1}{25}$	-2
-1	$\frac{1}{5}$	$\frac{1}{5}$	-1
0	1	1	0
1	5	5	1
2	25	25	2

(reflection across line of $y = x$)

4. reverse the coordinates for the x and y values and plot $y = \log_5 x$

When the log function gets more complicated, you will need to use transformations.

Parent function	$y = \log_b x$
stretch $a > 1$	$y = a \log_b x$
shrink $0 < a < 1$	big a the curve stretches or gets larger, vs. fraction a curve gets very thin
shift up/down shift left/right	$y = \log_b(x - h) + k$ where the h is a horizontal shift and the k is our vertical shift

Graph by first graphing the inverse, and exponential.

Graph $\log_2 x = y$

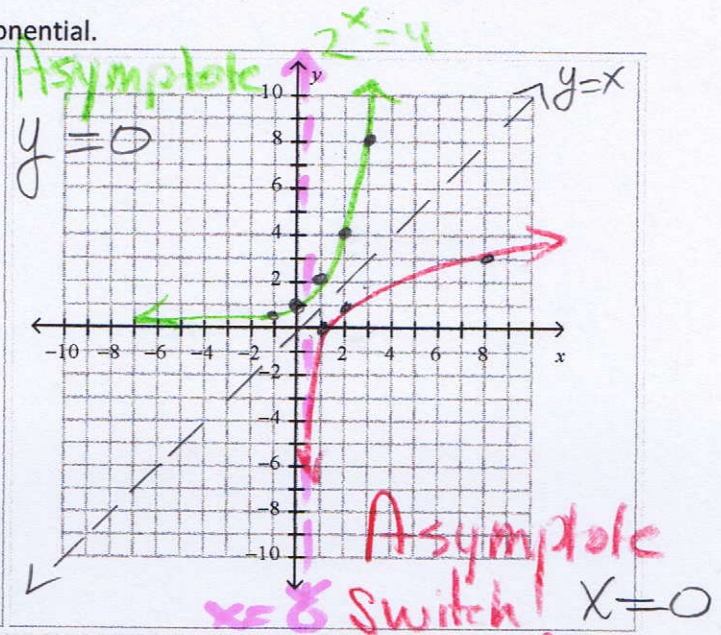

$2^y = x$

$2^x = y$

x	y
-3	1/8
-2	1/4
-1	1/2
0	1
1	2
2	4
3	8

Switch

X	y
